

PM: Some agencies shying away from IT as they can't cope with it

Nst 10 DEC 2000

KUALA LUMPUR, Sat. — Some government agencies and departments are shying away from adopting information technology in their operations as they are overwhelmed by it.

Prime Minister Datuk Seri Dr Mahathir Mohamad said today many felt they would be unable to handle the modernisation brought about by computers, hence the reluctance in utilising new methods.

"Although we have provided various means, they still want to use the old system," he said after launching the Survey and National Mapping Department's e-commerce portal.

It is the first e-commerce portal to be implemented in the public sector. It enables customers to survey information over the Internet.

Among the products available are digital survey data and certified

plan images which are required for land development, hence obtaining the necessary information fast through the Internet will help speed up the development of the country.

Dr Mahathir was asked to elaborate on his speech where he noted that while many departments and agencies had made full use of IT, some were still lagging.

"But if they start using the new system, they will find that it is not that difficult. What's needed is daily practice."

When pointed out that the Manpower and Implementation Unit had initiated an IT programme for all government agencies, the Prime Minister said there were still those who were uncomfortable with it.

"It concerns the mindset. When you are a bit older, difficult to accept doing things with just a click."

On what could be done to arrest

this, Dr Mahathir said the Government would continue training its staff.

"The question is there are many to be trained if compared to those qualified to train. So they will have to learn from these few trainers."

Despite this, Dr Mahathir felt Malaysia had made advances in IT and using computers in expediting work.

Earlier, the Prime Minister reminded civil servants on the need to keep abreast with IT development.

He said new things acquired today could become obsolete tomorrow.

"It helps to master the use of computers and IT.

"Only then can one create new methods or programmes to help expedite or enhance the quality of their work." Retirees can use IT for business, he added.
